

A scheduled rule AUTO DISABLED

Last updated by | Beatriz Marques | Mar 28, 2023 at 8:53 AM CDT

[Issue: A scheduled rule failed to execute, or appears with AUTO DISABLED added to the name](#) 

Customers do receive an email notification about it, But I have not found any official documentation about it.
[Tech Community](#) 

Custom alerting options for Analytic rule being AUTO DISABLED.

- This blog is going in detail how to monitor Microsoft Sentinel Analytic rules periodically and send notification immediately to the SOC Team via email or Teams post in case of any analytic rules gets auto-disabled via Playbook. [Monitoring Microsoft Sentinel Analytical Rules – Push Health Notifications - Microsoft Tech Community](#) 
- Secondly There is [SentinelHealth](#)  data table in Public Preview to monitor the health of your Sentinel resources such as Data Connectors, Analytic Rules and more. So, you could use this table to query Analytic rule related health logs and create analytic rule.
Just an example I found on Sentinel DL: `SentinelHealth | where SentinelResourceName startswith "AUTO DISABLED"`
- As per engineer notes: the health record will have in the Description: "Rule failed to run on multiple occasions and has been disabled. See 'aka.ms/DisabledRule' for more information." and Status will be "Warning". So instead of searching for `SentinelResourceName startswith "AUTO DISABLED"`, you can filter from the Status.
- Additionally, the table retention policy is 30 days, so after that, the logs won't be available on the SentinelHealth table.
